End to End Ticketing Solution

Following a successful partnership with Mastercard to be the first city in Asia to trial the direct payment of public transport fares using contactless credit and debit cards, we packaged the lessons learnt from the trial into our Symphony e-Payment back-office system which has been smoothly delivered to our clients abroad. Our solution has since evolved into our cloud / on-premise deployable microservices based Digital Mobility Platform, designed to help our clients break free from expensive vendor lock-ins.

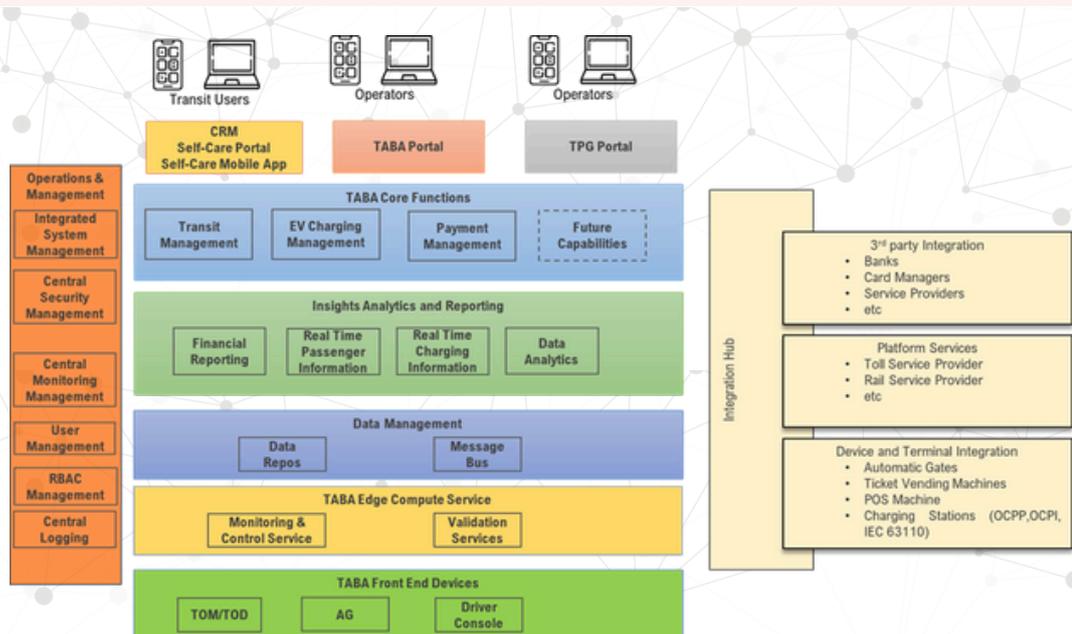

MSI ELYPSE SERIES

Built as a successor to the field proven 1st generation bus fare console used across 7,000 buses in Singapore, the MSI Elypse C unifies the management of all on-board bus systems within a single interface.

MICROSERVICES ARCHITECTURE

In anticipation of the evolving urban mobility landscape, MSI has developed a cloud native back-office system that supports integration with different mobility verticals. This back-office, named the Digital Mobility Platform, performs all the features of our Central Clearing House System and more.
